

Your personal proactive AI assistant

Boski works before you ask

ChatGPT waits for a prompt.
Boski is **proactive**.

It works in the background, moves tasks forward, and pings you only when it needs input, approval, or a decision.

A year from now, many people will have a personal agent working for them. This hackathon focuses on one hard part: **commerce**.

Visit boski.ai

SEND BOSKI A VOICE MEMO

“I need to change my car tires, schedule a visit with my mechanic please.”

Boski calls, coordinates, checks your schedule, and comes back when it needs approval.

Build agentic e-commerce transactions — go from a prompt to the purchase.

Agent Commerce: purchasing when the user is not in the tab.

Shopping is still built for humans

Users compare tabs, read reviews, check delivery windows, remember preferences, enter payment details, and chase support when something goes wrong.

Agents can help with research, but the actual transaction is still brittle. Product data is messy, checkout is UI-bound, and consent is unclear.

Today, one simple request breaks across:

THE BROKEN WORKFLOW

Find me the best monitor under \$300 that works with my MacBook, arrives tomorrow, and has good return terms. Buy it if you are confident.

I found options, but I cannot verify stock, complete checkout, or handle returns.

What to build: the purchase workflow agents need

Build the part between product research and a completed order.

TODAY

Product pages built for humans

Manual product comparison

Checkout built for humans

Unclear consent

Support starts from zero

TOMORROW

→ **Agent-readable offers**
Structured prices, stock, policies, availability

→ **Preference-aware recommendations**
The agent knows budget, constraints, and history

→ **Agent-ready payment flows**
x402 · Stripe MPP · Google AP2

→ **Approval flows, spending limits, and audit trails**
Checkout proposals · receipts · what the user agreed to

→ **Order tracking, exceptions, returns, and feedback loop**
The agent resolves what happens after the purchase

The challenge is not recommendations. It is the transaction workflow for agents.

How to win

Think first. Build second.

Strong teams will not just make a chatbot that recommends products. They will show how an agent moves from product research to a completed order while keeping the user in control.

Build the part between product research and a completed order.

Not a Boski integration.

Not a fake shopping chatbot.

A working purchase flow for agents.

JUDGING REWARDS

Useful buying flow

Solve buying, not browsing.

Clear agent steps

Discover → decide → approve → purchase → track → resolve.

Trust, safety & consent

The user stays in control at every step.

Working demo, realistic data

Mock the catalog, user profile, cart, checkout proposal, order status, cancellation, and returns API. Do not rebuild Amazon.

Generality

Works beyond one brand, store, or assistant.

The winner buys whatever they want

Up to 1000 PLN. Your pick.
